MACHINE LEARNING

In Q1 to Q11, only one option is correct, choose the correct option:

1. Which of the following methods do we u Regression?	se to find the best	fit line for data	in Linear
A) Least Square Error B) Maximum Lik Ans. Least Square Error	(elihood C) Log	arithmic Loss	D) Both A and B
2. Which of the following statement is trueA) Linear regression is sensitive to outliersC) Can't sayAns. linear regression is sensitive to outlier	B) linear re D) none of	egression is not	n? sensitive to outliers
3. A line falls from left to right if a slope is _ A) Positive B) Negative C) Zo Ans negative		ndefined	
4. Which of the following will have symmetr independent variable?A) Regression B) CorrelationAns. correlation	ric relation betwee	n dependent va D) None of	
	over fitting conditio Low bias and low none of these		
6. If output involves label then that model is A) Descriptive model B) Predictive in All of the above Ans.Reinforcement learning		C) Reinfo	orcement learning D
7. Lasso and Ridge regression techniquesA) Cross validationB) Removing outD) RegularizationAns Regularization		? SMOTE	
8. To overcome with imbalance dataset whi A) Cross validation B) Regularizati Ans. cross validation	•		OTE

 9. The AUC Receiver Operator Characteristic (Albinary classification problems. It uses to r A) TPR and FPR B) Sensitivity and pred D) Recall and precision Ans. Sensitivity and Specificity 	·		
10. The AUC Receiver Operator Characteristic (AUCROC) curve for the better model area under the curve should be less.A) True B) FalseAns. false			
11. Pick the feature extraction from below:A) Construction bag of words from a emailC) Removing stop wordsAns. A,B,C	B) Apply PCA to project high dimensional data D) Forward selection		
In Q12, more than one options are correct, choose all the correct options:			
12. Which of the following is true about the Norm the Linear Regression? A) We don't have to choose the learning rate. is very large. C) We need to iterate. ANS. A,B	nal Equation used to compute the coefficient of B) It becomes slow when number of features D) It does not make use of dependent variable.		
Q13 and Q15 are subjective answer type questions, Answer them briefly.			

13. Explain the term regularization?

Ans. Regularization is a way to avoid overfitting by penalizing high-valued regression coefficients. In simple terms, it reduces parameters and shrinks (simplifies) the model. This more streamlined, more parsimonious model will likely perform better at predictions

14. Which particular algorithms are used for regularization?

Ans. There are three main regularization techniques, namely:

- 1. Ridge Regression (L2 Norm)
- 2. Lasso (L1 Norm)
- 3. Dropout

15. Explain the term error present in linear regression equation?

Ans. error term is the difference between the expected price at a particular time and the price that was actually observed. the standard error of the estimate, represents the average price that the observed values fall from the regression line. Conveniently, it tells you how wrong the regression model is on average using the units of the response variable.
